Subject: File Review Preparation

Good afternoon,

Thank you again for your submittal of information to date regarding the DE PWSS program. I have a few comments and questions as we prepare for the kick-off meeting in few weeks.

I know that we had a discussion regarding CCR submittal and CCR certification at the end of the dry run training. I also note that in DE's submittal to Region III that the CCR submittal certification due date is July 10. Systems have until the June 30 to prepare and circulate the CCR to their customers. Based on the aforementioned dates and discussions with the CCR rule managers in EPA HQ and Region III, the certification should not have "will be" language within it.

I note that there are a few schools/daycares on the file review list. Given the recent articles in the news regarding elevated lead levels at some schools in Delaware, can you let Region III know if any of the target systems on the Region III file review system review list overlap with the schools mentioned in the articles? I note that Woodbridge High School is one that does. Can you identify if any of the other schools in the article are customers of any of the target community water systems?

Wilmington News Journal: [Elevated levels of lead detected in water sources at 47 Delaware schools](#) Elevated lead levels were found in dozens of schools across Delaware.

I also note that the Delaware submittal to Region III noted that Dover used to use Ozone but that it no longer does. When did Dover discontinue the use of Ozone in its water treatment? Is Dover using Chlorine Dioxide or something else? If so, what is Dover using for water treatment?

I look forward to speaking with you soon.
